**ACCELOPS BRINGS INTEGRATED DATACENTER MONITORING
AND IT SERVICE MANAGEMENT TO CHINA**

SANTA CLARA, CALIF. – December 9, 2009 – [AccelOps](#), the integrated datacenter monitoring leader, is expanding its operations into China and has opened its first office in Shanghai. The company is hiring an initial 25 new employees based in Shanghai, mostly engineers and software developers, to provide additional resources for extending and customizing the AccelOps datacenter monitoring platform. In parallel, the team will assess the Chinese datacenter market requirements to prepare for the localization and eventual introduction of AccelOps' products in China and other Asian regions.

"China is an ideal environment for us, both for its large pool of top engineering talent and the strategic IT market opportunity it presents," said Imin Lee, CEO of AccelOps. "You must have a global mind set to be extremely successful in business today, and eventually China will be one third of world's economy. Even now the sheer size and number of people in China using the Internet and telecom services creates gigantic data centers. Since there is no IT infrastructure legacy in China, these datacenters make extensive use of cloud computing and are also leading edge. They need a fully integrated, next-generation datacenter and IT service management solution like AccelOps."

As a Chinese native who came to the United States in the 1980s to study and work, Ms. Lee is well positioned to execute on this strategy. She understands the intricacies and nuances of the business and popular culture in China, its market economy and relationships with the U.S.

"It is a very different market. For one thing, Internet use is pervasive, but the primary user device is the mobile phone, not the PC. Even migrant workers use cell phones, because it is the lowest cost way to access entertainment, news, books or games," said Lee.

About AccelOps, How IT Accelerates Business

AccelOps provides award-winning datacenter monitoring and [IT service management](#) software delivered as a virtual appliance or SaaS. The all-in-one solution assures service reliability through integrated datacenter monitoring, alerting, analysis and reporting across performance, availability, security and change management. The integrated approach aggregates, cross-correlates and manages diverse operational data to yield end-to-end visibility, service intelligence, operational efficiency and compliance automation. The Silicon Valley-based company is privately held, venture-backed and led by experienced technology executives who created the popular Cisco MARS security information management appliance.
